

CONNECTED HEALTH:

THE ROLE OF

DATA NETWORKS

IN THE HEALTHCARE ECOSYSTEM

Healthcare delivery is changing due to the digitization and mobility of data. Strong, reliable networks are more important than ever.

Comcast is uniquely positioned to provide end-to-end healthcare solutions—from the hospital to the home. Comcast Business provides capacity to support data connectivity for healthcare providers. Patients stay connected through Comcast Cable, the nation's largest video and Internet provider to residential customers.

Comcast's advanced technology services can help healthcare organizations improve the continuity of patient care—onsite, across multiple locations and to the home.

PATIENT'S HOME

Hospitals seek ways to collaborate with patients to improve outcomes and promote healthy behaviors. Comcast Cable is trialing an innovative patient engagement platform that delivers customized, provider-branded health content via the patient's residential TV service.

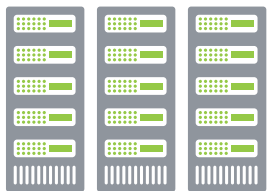

YOUR HOSPITAL

Every hospital needs a high-performance network to support mission-critical applications for EHRs, PACS, telemedicine and other data-intensive systems. Comcast Business Ethernet provides scalable capacity up to 10Gbps.

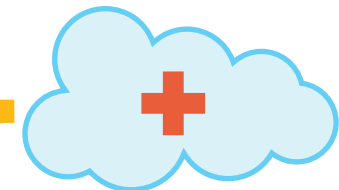

CLINICIAN'S HOME

Clinicians need uninterrupted access to patient files when and where needed. Comcast Ethernet @HomeSM gives clinicians the ability to quickly and securely access large files over the hospital's private network, while working from home.

THIRD-PARTY DATA CENTERS

Data centers give hospitals a secure environment for storage, application production and off-premise work flows. Comcast Business has extended its fiber network into several hundred data centers across the U.S.

CLOUD CONNECTIVITY

Many healthcare organizations are moving servers, storage and mission-critical applications to the cloud, which requires a robust network. Comcast Business offers direct connectivity to many leading cloud service providers.

LOCATION-TO-LOCATION CONNECTIONS

A high-capacity WAN is necessary for connecting multiple sites within the health system. Comcast Business Ethernet connects geographically dispersed locations to make them function like they are part of one office.
